

Cloud solutions from Vodat International

Invest in faster, more flexible enterprise cloud solutions

Many industries are increasingly experiencing the benefits of investments in enterprise cloud technology, as they look to make critical business decisions faster and more cost effectively.

Scalable, pay-as-you-use private cloud solutions provide organisations with flexibility, avoiding the prohibitive structure of up-front costs and inflexible IT that prevent you from providing the products and services your customers demand.

Whether it's for hosting, back-up, replication or disaster recovery (DR) purposes, cloud services represent the solution for the modern, forward-thinking enterprise looking to build agility into their operations.

How does it work?

Companies that deploy our private cloud service do not have to own IT infrastructure or servers to run their business applications and enterprise data.

Our private, virtual cloud guarantees organisations connectivity, security and performance, with default firewall rules for each individual user. The key features of the service are the virtual and physical servers, which are available in a variety of configurations and compute sizes.

Users can self serve or benefit from our fully-managed service.

Why Vodat?

We provide exemplary customer support, and our mission is to be part of your strategic planning process.

Companies can use the services they want, when they want – supported by a high-speed network that promises scalability, security and substantial support.

Vodat has a track record of success in the retail and hospitality sectors, and we are quick to market with the latest advancements in network and cloud solutions to help your business grow.

Cloud hosting gives organisations more control and flexibility, and is highly cost efficient

Back-up and disaster recovery

Tech outages can seriously impact business continuity, but with cloud-based disaster recovery solutions, organisations are suitably protected.

Businesses must innovate and find new ways to delight their customers, but preparation and back-up is crucial in a data and tech-led business landscape.

As high-profile enterprise tech failures have highlighted, organisations can benefit from comprehensive DR processes to enable business continuity. We provide flexible on-premise, cloud and hybrid DR solutions to meet these needs.

Hosting

Cloud hosting gives organisations more control and flexibility, and is highly cost efficient.

We provide server and hardware hosting within four prime data centre locations, as well as fully-managed private virtual and hardware hosting through our strategic partnerships.

Companies with an international footprint can access data centres by territory, allowing them to meet local data privacy needs and run local applications seamlessly.
