

Security solutions from Vodat international

Empower your staff and your customers to use technology that is safe, secure and protected

The threat of cybercrime – be it ransomware, hacking, malware via malicious attachments, stolen passwords, or social attacks – has never been greater, and your IT teams must take responsibility to protect your staff, customers and overall business operations.

Technology has revolutionised the customer experience in recent years and helped organisations to save money, but the advent of new systems and devices has made businesses vulnerable to criminal activity.

Powerful and protective security solutions are required to fend off point of sale breaches, online fraud, DoS attacks, phishing and other data theft, allowing your business to focus on the things that truly matter – customer care, commercial growth and creating a positive workplace environment.

How does it work?

Vodat International's security solutions are cloud-based, easy to deploy and flexible to manage. Our managed service for email/web/cyber security and firewall protection allows you to outsource your security management to a dedicated expert in the field.

An easy-to-use central management console lets you define web usage policies applied to your entire organisation, regardless of where your users are located. The granular policy enforcement allows you to manage what each employee can do online, while real-time reporting and analytics enable you to keep track of all activity and threats.

Why Vodat?

We provide exemplary customer support, and our mission is to be part of your strategic planning process.

With our security solutions, you can protect your business from web-based threats – as well as those you are exposed to internally from your employees' increasing amount of online activity (including personal use). Vodat can safeguard your all-important data and intellectual property, and help ensure compliance with the latest regulations.

Working with the latest security partners, we can continuously monitor device behaviour and identify threats throughout in real-time. Whether a threat occurs on laptop, employee devices, printers, servers or any IP-enabled device, we'll identify it, monitor it and address it.

KEY BENEFITS OF VODAT SECURITY SOLUTIONS

- Comprehensive solutions to prevent web/email/cloud/wireless attacks
- Scalability - roll solutions out across your estate
- Manage your employees' internet browsing
- Unique - tailored to your business goals

- Fully managed 24x7 service and technical support
- BYOD compatible - secure your staff's own personal devices
- Compliant - help your business meet industry security standards
- Supports your latest in-store tech investments
- Real-time analytics on web activity and threats

Internet security

So much of your business is now conducted online that it's essential your web usage is secure and protected – but not prohibited.

Your business is increasingly using the web for employee and customer engagement, as well as to run various critical systems.

Vodat International's cloud-based web security complements the Vodat Managed Firewall, and can be tailored to the exact requirements of your business.

Benefit from safe access across all devices – on location or on the move – which is vital for today's mobilised businesses looking to avoid restrictions that impact your employees' ability to fulfil their roles. Two-factor authentication for your employees' smartphones ensures secure and reliable service on their own personal devices wherever they choose to work.

cloud-based web
security solutions
can be tailored to the
exact requirements
of your business**

Email

The proliferation of data security, privacy and compliance legislation impacting your industry means it's vital you have easy access to your business information.

If your company was required to produce specific emails or other business intelligence compiled on a previous date, how easy would you be able to find the information? Vodat offers easy-to-use, fully-supported services to meet these demands.

Data privacy and security regulations can be a challenge, but we have the solutions to simplify the process.

Dual protection

Firewall service is delivered as a dual system, and runs across two London datacentres.

The active/passive set-up means that in the event of the active firewall failing or the primary site being lost, the passive firewall will take over all processing.

Vodat's hosted firewall platform contains anti-virus, web filtering, application control and intrusion prevention capability, providing comprehensive protection for your business.
